|       |                           |                                               | management in these ecosystems influences fire and forest health. We work directly with forest managers to both address specific research questions and interpret results in a management-relevant context. We frequently communicate our research findings to and learn from a broad host of audiences including policy makers, land management agencies, private forestland managers, students, and interested public.                                                                                                                                                                                                                                                                                | <p>Initial Changes in Forest Understory Communities Following Fuel Reduction Treatments</p> <p>Fire regimes of mixed conifer forests in the north-central Sierra Nevada at multiple spatial scales</p> <p>Regional relationships between climate and wildfire burned area in the Interior West, USA</p> |
| Kurt  | <a href="#">Cuffey</a>    | L&S - Earth and Planetary Sciences, Geography | Cuffey's research emphasizes the environmental change of polar regions, with a focus on glaciologic problems. The choice of polar glaciology reflects the unique and powerful contributions that this subdiscipline makes to environmental change research. Ice core reconstructions of environmental history offer the most comprehensive, varied, and high-resolution view yet achieved of past environments. The ice sheets themselves are a major control on global sea level and albedo, and on high-latitude atmospheric and oceanic circulations, and on physical landscape characteristics. No other topographic features of this size and importance are changeable on such short time scales. | <a href="#">Glaciology (EPS C242 / Geog C241 (SPRING 2024))</a>                                                                                                                                                                                                                                         |

|         |                        |                           | ecosystems. Through the analysis of the soil water balance, we have highlighted important nonlinearities in the coupling between soil moisture dynamics and plant water stress, biogeochemical cycling, land-atmosphere interactions, plant community composition, and soil susceptibility to wind erosion.                                                                                                                                                                                                                                                                                   |                                                                                                                                                |
| Todd    | <a href="#">Dawson</a> | L&S - Integrative Biology | Research in Dawson's laboratory focuses on the interface between plants and their environment. The tools of physiological and evolutionary plant ecology and stable isotope biogeochemistry are currently being applied towards the study and interpretation of this interface. Projects pay special attention to how aspects of plant form and function combine to permit adaptation to environmental variation, whether naturally or anthropogenically imposed, and how plants and their unique traits influence the structure and function of the communities and ecosystems they compose. | <a href="#">The Fog and the Redwood on Science Friday</a><br><br><a href="#">2024 papers on climate change and soil carbon, ag. bats, etc.</a> |
| Richard | <a href="#">Dodd</a>   | RCNR- ESPM                | Climate change and habitat fragmentation are two major concerns for the future health of forests and woodlands and the diversity of organisms that depend on these ecosystems. Research in the Dodd lab uses molecular methods to investigate the evolutionary dynamics of populations of species and species complexes in response to past and future environmental change                                                                                                                                                                                                                   |                                                                                                                                                |

| Caroline | <a href="#">Williams</a>   | L&S - Integrative Biology                    | <p>The Williams lab studies the evolution of metabolic physiology in ectotherms, using insects as models. We are interested in the mechanisms and consequences of metabolic responses to emerging winter environments. This is important because winter climate change is altering energy balance, phenology, and cold stress in overwintering organisms leading to cascading biological impacts that carry over into the growing season and affect survival and fitness.</p> <p>Academic Senate committee on climate</p> |                                                                                                       |
